USER INTERFACE DESIGN

ASSIGNMENT

TITLE: ASSIGNMENT 2

PREPARED FOR:

DR. INTAN YUSRINA BINTI ZAIRON

PREPARED BY:

MUHAMMAD MIKAIL BIN SHAHRUL NIZAM (2539012)

SESSION I 2026/2027

FACULTY OF CREATIVE MULTIMEDIA AND COMPUTING

UNIVERSITI ISLAM SELANGOR (UIS)

Design Phase Report

Unift – A Student Campus Food Delivery platform

1. Introduction

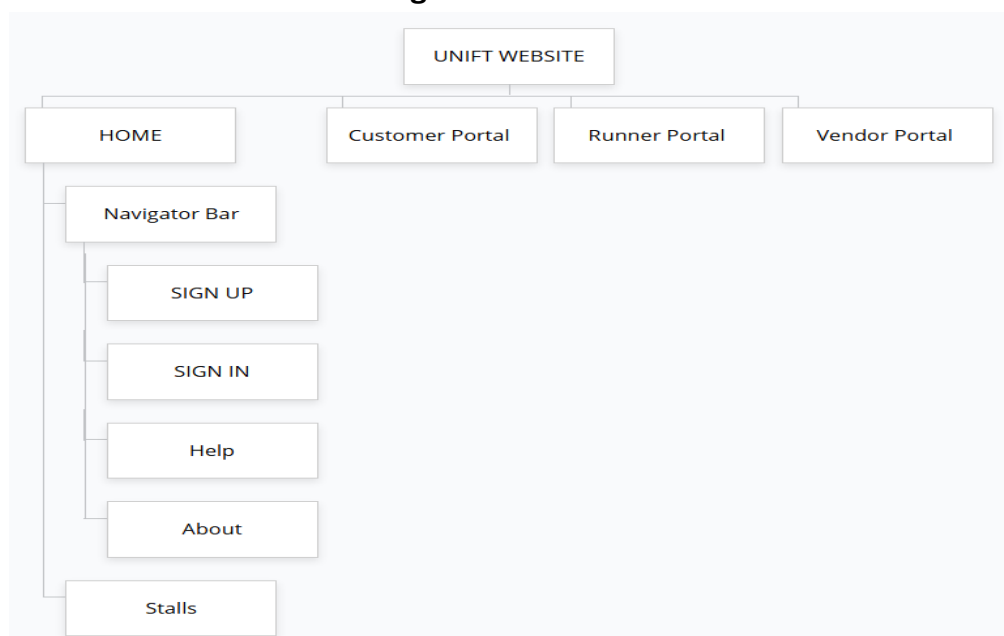

Unift connects students who want food to be delivered to them through other fellow students, called runners, who can earn an income by delivering the food. It addresses everyday campus problems, which are: being buried in assignment to queue at the cafeteria, feeling too tired to walk, being unwell, and more.

2. Information Architecture

The site map (diagram 1) possesses three main roles instead of a generic list of marketing pages. From Home, 2 sections cover what a first-time visitor needs. Browse stalls, information about the website, help & support, and sign up/sign in.

After the user signs up or signs in, they will be directed to the Home page. The Sign Up and Sign In options will be replaced by a Profile icon. When the user hovers over the Profile icon, three options will appear: Customer Portal, Runner Portal, and Vendor Portal. Although the Home page provides some students/consumers functions, such as searching for stalls, the user will automatically be directed to the Student Portal when they use the stall search function. This allows them to access the full customer features and continue with their orders or other activities.

3. Wireframe Design

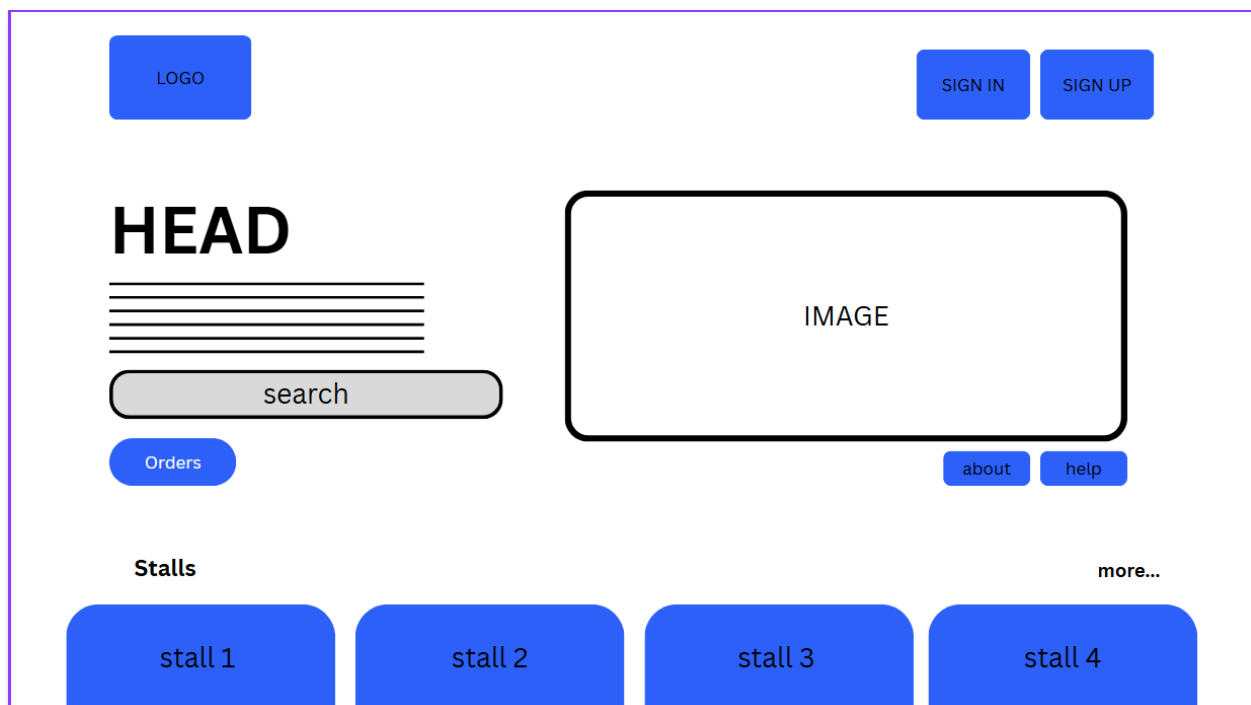

The wireframes cover five screens, which are the home page, the sign in/sign up page, and the three portals for students and vendors.

The home page puts the logo, profile, login, and sign in/up where it is expected to be placed in the header. The main content will display information about the website and website images or ads with a search bar and an order shortcut so ordering doesn't need scrolling. The footer will display the top recommendations of vendors with the most orders.

The sign in/up page is plain – one form, three fields, nothing eye-catching because signing up is something people want to get through quickly.

about

For the three portals, having almost the same layout a sidebar on the left with a logo, a menu button for each role, and Help sitting at the bottom in the same spot for the help & support guide. Top right always shows a status chip; each are different from others. Main content will consist of a couple of boxes. For the students, there will be a search bar for searching what to order and a vibe/mood to show their current state for the runner to know. Moreover, order tracking, stalls, and recent orders will be presenting so the students know where their food at, what stalls are available, and their order history. For runner, they will see their total runs, earnings, runtime, and payout. Below that will display student orders which is on the left and on the right is the active delivery to notify the students if their food is being picked up, on the way or delivered. At the bottom is the delivery history for runners. For the vendor portal, the main content will present details consist of today's orders, sales, avg. prep time, week payout. Orders show incoming orders; the queue will show orders from students using the FIFO (First in, First out) principle. Menus display food and beverages to students and a payout box

4. Design choices for navigation, accessibility and layout

Splitting navigation by role was the main choice made here. A student never see runner menus and a runner never sees vendor ones, so nobody scans past options that don't apply to them. The important actions is kept near the top instead of buried further down: searching, checking orders, and reaching Help are all visible without scrolling. Repeating the same box layout across the three portals was as much about accessibility as consistency. Once someone learns where 'orders' lives on one portal, they don't have to relearn it on the next.

5. Conclusion

These wireframes are still rough and that's the point at this stage. They're meant to test whether the structure holds up before any real styling goes in. Between the site map and these layouts, the goal was to get a student to order in as few steps as possible, and to give runners and vendors a version of that same experience that fits what they're each trying to do.
